Task-3 :

Using Clauses, operators and Functions in queries.

Aim:

To perform query processing on a Temple Ticket Online Booking Management system for different retrieval results of queries using DML, DRL operations with aggregate functions, date functions, string functions, set clauses, and operators.

Temple.

c. One-to-one (Booking ↔ Event)

- Each booking is made for one event.

d. One-to-one or one-to-many:

Payment → Booking:

- Each payment is tied to a booking

2. Surplus relations:

Here we identify entities that might be redundant, merged or consolidated for normalization.

a. Ticket may be merged with booking (1:1 or 1:N)

b. Event details redundant in booking

c. payment and Booking 1:1 relation.

2b. check is-a hierarchy / has-a-hierarchy and performs generalization and/or specialization relationship.

- devotee is a person (if extended to priest, admin)
- Event/seva is a service of various temple.
- services are modeled.
- Booking has a ticket.
- Booking has a relationship with user and temple.

Generalization:

- person (general) → devotee (specialized)
- service → Event/seva.

DATE : 31-07-25

Task 2 : Generating design of other traditional database model

Aim : Creating Hierarchical/Network model of the database by enhancing the sound abstract data by enhancing the sound abstract data by performing following tasks using forms of inheritance:

2.a. Identify the specificity of each relationship, find and form surplus relations.

2.b. check is a Hierarchy / has-a - hierarchy and performs generalization and/or specialization relationship.

2c, Find the domain of the attribute and perform check constraint to the applicable.

2d. Rename the relations.

2e. perform SQL relations using DDL, DCL Commands

2a. Identify the specificity of each relationship, find and form surplus relations

1. Relationship specificity:

a. one-to-many (Devotees ↔ Booking):

- Each devotee can have many bookings
- Each booking is uniquely linked to one devotee

b. (Booking ↔ ticket) one-to-one:

- one booking generates one or more tickets
- Ticket is dependent on Booking

- Admin : Admin_ID, Name, Username, Password, Role.

Types of Attributes:

- Simple : Name, price.
- Composite : Address (street, city, State)
- Multi-Valued : phone
- Derived : Age (from DOB)

Relationships:

- Devotee → Booking (makes)
- Booking → Event (for)
- Booking → payment (has)
- Booking → Ticket (generates)
- Event → Temple (hosts)
- Admin → Event (Manages).

Relationship Types:

- One-to-one : Booking → payment, Booking → Ticke
- one-to-many : Devotee → Booking
- Many-to-one : Booking → Event
- One-to-many : Temple → Event
- One-to-many : Admin → Event.

Cardinality:

- 1 : N and 1 : 1 where applicable.

Relationship:

An association or interaction between two or more entities. For example a student might enroll in a course, establishing a relationship between the "student" and "Course" entities.

Aim:

To design and develop an Entity-relationship(ER) model for a Temple ticket online Booking management system that allows devotes to 10000 tickets for temple visits, special darshans, poojas, and other events online, reducing physical queues and improving crowd management.

Attributes:

- Devotee : Devotee-ID, Name, phone, Email, Address, Age, Gender.
- Booking : Booking-ID, Data, Time_slot, No_of_persons, Status.
- Event : Event_ID, Event_Name, Description, price, Event_type, duration.
- Temple : Temple_ID, Temple_Name, location, opening_hoors.
- Payment : Payment_ID, issue_Date, QR_Code, Amo Method, states, Date.
- Ticket : Ticket_ID, issue_Date, QR_code, validity.

DATE : 24-07-2025

Task-1

A Temple ticket online booking Management System

A temple ticket online booking Management system allows devotes to book tickets for temple visits, special darshan, poojas, and other events online, reducing physical queues and improving crowd Management. These systems often include features like date and time slot selection, payment processing and the generation of tickets or passes.

Entity:

The real-world object or concept that can be distinctly identical. examples included students courses, or products.

Entity Set:

A collection of entities of the same type. For instance, all students in a university would form an entity set

Attribute:

A property or characteristic of an entity. For example, a student might have attributes like name, ID and major.

Date: 4/09/25

Task 7: Triggers, views and Exceptions.

Aim:

To ~~Coudt~~ conduct events, views, exceptions on CRUD operations for restricting phenomenon in a Temple online Booking Management system.

(a) To create a trigger in PL/SQL that automatically inserts a new record in the booking_audit table when a new record is inserted into the bookings table.

(b) To create a view that displays the details of bookings along with the user and temple details.

(c) To write a non-recursive PL/SQL procedure to retrieve even-numbered BookingIDs registered for any Temple.

(a) Trigger

To create a trigger in PL/SQL that automatically inserts a new record in the booking_audit table when a new record is inserted into the bookings table.

```
CREATE OR REPLACE TRIGGER
    insert_booking_audit.
    AFTER INSERT ON bookings.
      FOR EACH ROW
      BEGIN
```

4) Non-recursive procedure to retrieve even-numbered Booking IDs.

```
CREATE OR REPLACE PROCEDURE
Get Even Numbered Booking IDs.
IS
BEGIN
  FOR rec IN C
    SELECT BookingID
     FROM Booking.
     WHERE NOT (TO-NUMBER (BookingID), 2) =0
    )
    loop.
    DBMS-OUTPUT.PUT.LINE ('Even-Numbered
Booking ID:' || rec. BookingID);
   END loop;
   END Get Even Numbered Booking IDs;
/
Run the Procedure.
 BEGIN.
    Get Even Numbered Booking IDs;
  END;
/
```

VEL TECH - CSE

Result:

Thus the PL/SQL Procedures, functions and loops on the Temple online Booking management system were successfully implemented and tested.

```
DBMS_OUTPUT.PUT_LINE ('Booking record
inserted successfully:');
EXCEPTION
   WHEN OTHERS THEN
   DBMS_OUTPUT.PUT_LINE ('Error:' || SQLERM);
   ROLLBACK;
    END;
   /
```

3) Function to return total number of bookings in a particular Temple.

```
CREATE OR REPLACE FUNCTION
Get Total Bookings IN Temple (P_TempleID
VARCHAR 2)
RETURN NUMBER.
IS.
 V_Total NUMBER; =0;
 BEGIN.
 SELECT COUNT (*) INTO V_Total.
   FROM Booking
   WHERE TempleID = P_TempleID;
  RETURN V_Total;
EXCEPTION
  WHEN NO_DATA_FOUND THEN
    RETURN 0;
  WHEN OTHERS THEN.
    RETURN -1;
  END Get Total Bookings IN Temple;
  /.
```

2) PL/SQL block that inserts a new booking into the Booking table.

```
DECLARE
   v_BookingID VARCHAR2(10) := '&BookingID';
-- e.g., 'BKG203'
   v_DevoteeID VARCHAR2(10) := '&DevoteeID';
-- e.g., 'DEV045'
   v_TempleID VARCHAR2(10) := '&TempleID';
-- e.g., 'TMP001'
   v_BookingDate DATE :=
TO_DATE('&BDate', 'YYYY-MM-DD');--
 e.g., 2025-09-01
 v_slot VARCHAR2(20) := '&slot';--
 e.g., '06:00-07:00'
 v_sevatype VARCHAR2(30) := '&sevatype';
 --e.g; 'Archana'
 v_Amount NUMBER(10,2) := &Amount;
 -- e.g; 250.00
 v_status VARCHAR2(15) := '&status';
BEGIN
  INSERT INTO Booking
  (BookingID, DevoteeID, TempleID, BookingDate, slot,
sevatype, Amount, status)
  VALUES
  (v_BookingID, v_DevoteeID, v_TempleID, v_BookingDate, v_slot, v_sevaType, v_Amount, v_status);
  COMMIT;
```

Enter value for Devotee ID : DEV045.
Enter value for Temple ID : TMP001
Enter value for BDate : 2025-09-01
Enter value for slot : 06:00-07:00
Enter value for sevatype : Archana.
Enter value for Amount : 250.
Enter value for. Status : CONFIRMED
Booking record inserted successfully.

3. output.

NO. of bookings in temple : 42.

4. output.

Even_Numbered BookingID : 102.
Even_Numbered BookingID : 204
Even_Numbered BookingID : 306

```
FOR rec IN(SELECT Age FROM Devotee) loop
 v_total_age := v_total_age + NVL(rec.Age,0);
 v_count_devs := v_count_devs + 1;
 END loop;
 If v_count_devs >0 THEN.
   v_avg_age := v_total_age./v_count_devs;
 END IF;
 -- Displaying the result
 DBMS_OUTPUT.PUT_LINE('Total Devotees:'|| v_count_
 devs);
 DBMS_OUTPUT.PUT_LINE('Average Age :'|| TO_CHAR
 (ROUND(v_avg_age , 2)));
 END;
 /
```

Date : 28-8-25

Task-6 : Procedures, Function and Loops.-
Temple online Booking.

Aim:

1. write PL/SQL block that calculates the average age of devotees and displays the result.
2. write a PL/SQL block that inserts a new booking into the booking Table.
3. Create a function that returns the Total number of bookings for a particular Temple.
4. Write a non-recursive PL/SQL Procedure to retrieve even-numbered Booking IDs registered for any seva.

(1) PL/SQL block that calculates the average age of devotees and displays the result.

```
DECLARE
    v_total_age NUMBER := 0;
    v_count_devs NUMBER := 0;
    v_avg_age NUMBER := 0;
BEGIN
    -- Loop through all devotees and aggregate age.
```

1. Sample output

Total Devotees : 120
Total Age : 3060
Average Age : 25.5.

2. Sample output

Enter value for Booking ID : BKG203

5.10 To retrieve temple, pooja, and devoote details for a given BookingID.

```
SELECT t.Name AS Temple, p.PoojaName,
d.FName AS Devotee, b.BookingDate, b.SlotTime.
FROM Booking b
JOIN Temple t ON b.TempleID = t.TempleID
JOIN Pooja P ON b.PoojaID = P.PoojaID
JOIN Devotee d ON b.DevoteeID = d.DevoteeID
WHERE b.BookingID = '8102';
```

21/08/25.

Task-5: Writing Join Queries, equivalent, and/or recursive queries:

Aim:

To perform advanced query processing and test its heuristic using Join Queries, equivalent queries, and recursive queries for the Temple Ticket Online Booking Management System, which manages devotees, priests, poojas, tickets, and booking details.

Queries and outputs.

5.1 To retrieve all temples and their poojas.

Sql

```
SELECT t.Name AS Temple, p.PoojaName, p.Price
FROM Temple t.
JOIN Pooja p ON TempleID = p.TempbID;
```

5.2 To list all bookings along with the devotee and pooja details.

Sql

```
SELECT b.BookingID, d.FName AS Devotee, p.PoojaNam
b.BookingDate, b.SlotTime, b.Status.
FROM Booking b.
JOIN Devotee d ON b.DevoteeID = d.DevoteeID.
JOIN Pooja p ON b.PoojaID = P.PoojaID;
```

4.5: To retrieve the details of temples with no bookings

```
SELECT *
FROM Temple
WHERE TemplID NOT IN (
    SELECT TemplID
    FROM Booking
);
```

4.6: To retrieve the templeid, temple name, and visitor name for a particular visitorid given

```
SELECT t.TemplID,
       t.Name AS TemplName,
       v.FName AS visitorName
FROM Temple t
JOIN Booking b
ON t.templeID = b:TemplID
WHERE visitor v'
ON b.visitorID = v.visitorID
WHERE v.visitorID = 'V005';

       b.BookingID,
       b.Booking_Date,
       b.Ticket_Type,
       b.Amount
FROM visitor v
JOIN Booking b
ON v.VisitorID = b.visitorID
WHERE v.Age > 25;
```

Output:

TempleID	Temple Name	Location	Contact_No	Total Booking
TID01	Tirumala Venkateswara	Tirupati	9876543210	3
TID02	Meenakshi Amman	Madurai	9867543210	1
TID03	Kashi Vishwanath	Varanasi	9856543210	1
TID04	Jagannath Temple	Puri	9856543210	0
TID05	Golden Temple	Amritsar	9836543210	0

Date: 14-8-25

Task-4:
Using functions in Queries and writing Sub queries:

Aim:
To perform advanced query processing and test its heuristics by designing optimal correlated and nested subqueries such as finding summary statistics in the Temple Ticket Online Booking Management System.

4.1: To retrieve all temple details, including the count of bookings for each temple.

```
SELECT t.TempleID,
       t.Name As TempleName,
       t.Location,
       t.Contact_No,
       COUNT(b.BookingID) As TotalBookings
FROM Temple t
LEFT JOIN Booking b
ON t.TempleID = b.TempleID
Group By t.TempleID, t.Name, t.Location, t.Contact_No;
```

4.2: To retrieve the total number of 'special' seva bookings in a temple-wise manner.

```
SELECT t.Name. As TempleName,
    COUNT(*) As TotalSpecialBookings
FROM Temple t
```

7. Find the PriestID of priests who have not been assigned any temples.

```
SELECT PriestID
FROM Priest
WHERE TempleID is NULL;
```

Result :

PriestID.

VEL TECH - CSE	
EX NO	3
PERFORMANCE (5)	5
RESULT AND ANALYSIS (5)	5
VIVA VOCE (5)	3
RECORD (5)	4
TOTAL (20)	5+4=17
SIGN WITH DATE	

Result:

Thus, query processing for Temple Ticket Online Booking Management using clauses, operators, and functions was successfully performed.

5. Display temple details for TempleIDs 'TID01', 'TID03', and 'TID05'.

```
SELECT *
FROM Temple.
WHERE TempleID IN ('TID01', 'TID03', 'TID05');
```

Result:

TempleID	Name	Location	Contact_No.
TID01	Tirumala Venkateswara	Tirupati	9876543210
TID03	Kashi Vishwanath	Varanasi	9856543210.
TID05	Golden Temple.	Amritsar	9836543210.

6. Select VisitorID and names of visitors who booked 'special' tickets.

```
SELECT VisitorID, FName, LName.
FROM Visitor.
WHERE VisitorID IN (
    SELECT VisitorID FROM Booking WHERE Ticket_Type =
                                        'special'.
);
```

Result:

VisitorID	FName	LName.
V005	Sneha	Rao.

2. Retrieve details of visitors whose first name starts with 'A'

```
Select *
FROM visitor.
WHERE FName LIKE 'A%';
```

Result:

Visitor ID	FName	LName	Age	Email	Contact_No
V002	Akash	Reddy	25	akashr@gmail.com	9123456781
V004	Aarav	Patel	35	aaravp@gmail.com	9123476783

3. Add a column for 'Special_Seva' in Bookingtable.

```
ALTER TABLE Booking ADD Special_Seva VARCHAR(50);
```

Result:
Table altered successfully.

4. Count the number of VIP ticket bookings.

```
SELECT COUNT(*)
FROM Booking
WHERE Ticket_Type = 'VIP';
```

Result:

Count(*)

steps to Create menus in oracle Forms:

1. open Oracle Forms Builder.
2. Create a new menu from or use an existing one.
3. Add menu items for each major function, such as:
   - Book Tickets
   - View Booking History
   - Cancel Tickets
   - Manage Temples
   - Reports.
4. Define menu hierarchy (e.g., Book Tickets → Select Temple → Choose Ticket Type).
5. Assign triggers or procedures to handle menu item actions (e.g., open booking form).
6. Compile and run the menu form to test the navigation flow.

Design Forms:

Forms are used to capture, display, and edit data related to ticket booking.

steps to design forms in Oracle Forms:

1. Create a new form for each major component of the booking system such as:
   - Ticket Booking Form
   - User Registration Form
   - Payment Processing Form
   - Booking Cancellation Form.
2. Add form elements like text fields, buttons, and labels
3. Use the property Palette to configure element properties and link data blocks to database tables.

DATE: 09/10/25

Task-11 : Menus, Forms and Reports.

Aim:

To design an online Temple Ticket Booking Management system using Oracle Forms, Menus, and Report Builder. The system involves creating a user interface (UI) for booking tickets online, managing bookings, and generating reports related to ticket sales and temple visits.

Install Oracle Forms and Report Builder:

Ensure Oracle Forms and Report Builder are installed on your development machine to build and test the application.

Design the Data Model:

In Oracle Forms, define the data model that connects to the database schema for the temple ticket booking system. Use the Data Block Wizard to create book data blocks that represent key tables or views such as:

- Temples.
- Ticket Types.
- Booking Details
- Users/Devotees.
- Payment Information.

Set up data blocks for all necessary data to manage ticket booking, user details, and payments

Create Menus:

Menus provide the navigation structure for the booking system application

- Unique Constraints :- U Email, U Contact.
- check constraints :
  - Price > 0
  - Payment status ∈ {'Pending', 'completed', 'failed'}
  - Time_slot within valid darshan timings

VEL TECH - CSE	
EX NO	10
PERFORMANCE (5)	5
RESULT AND ANALYSIS (5)	5
VIVA VOCE (5)	5
RECORD (5)	5
TOTAL (20)	20
N WITH DATE	

25/9

Results:

Thus, The given relation for the online temple ticket Booking management system has been normalized into simplified tables up to third normal form (3NF) with suitable constraints, reducing redundancy and improving data integrity.

- Booking ID → Ticket ID → Ticket Type, price.
- Booking ID → Payment ID → Payment mode

Final Simplified Table in 3NF.

1) User Table.
   User (UserID [PK], UName, U Email, U contact)

2) Temple Table.
   Temple (TempleID [PK], TName, Tlocation)

3) Priest Table.
   Priest (Priest ID [PK], priest Name, priestcontact)

4) Ticket Table.
   Ticket (Ticket ID [PK], tickettype, Price)

5) Payment Table.
   ~~Payment~~ (Payment ID [PK], Payment mode, Payment status)

6) Booking Table.
   Booking (Booking ID [PK], user ID [FK],)

Constraints:

- Primary keys: Booking ID, & User ID, Temple ID, Priest ID.
- Foreign keys:
- Booking. UserID → User. User ID
- Booking. TempleID → Temple. Temple ID
- Booking. PriestID → Priest. Priest ID
- Booking. Ticket ID → Ticket. Ticket ID
- Booking. payment ID → payment. payment ID.

from a+ (closure of Candidate Keys):

- Booking ID$^+$ = {All attributes} → confirms Booking ID is a Candidate key
- User ID, Temple ID, Priest ID, Ticket ID, Payment ID also act as foreign keys. with their own dependencies

Step 3(c): minimal cover/ canonical cover.

we reduce FDs to minimal form:

1. User ID → UName, UEmail, Ucontact.
2. Temple ID → TName, Tlocation.
3. Priest ID → PriestName, Priest contact.
4. Ticket ID → Ticket type, price.
5. Payment ID → Payment Node, payment status.

step(d): Normalize to 2NF.

Conditions for 2NF:

- Must already be in 1NF.
- No partial dependency.

Here, Booking ID is a primary key.
so no partial dependency exists.
The schema is in 2NF.

Step(e): Normalize to 3NF.

Conditions for 3NF:

- Must already be in 2NF.
- No transitive dependencies.
- Booking ID → userID → UName.
- Booking ID → TempleID → TName.
- Booking ID → Priest ID → Priest Name.

DATE: 25/09/25.

Task-10: Normalizing databases using functional dependencies Up to Third Normal.

Aim:

To normalizing the below relation and create the simplified tables with suitable constraints for the online Temple ticket Booking management system.

Given Relation:

Temple Booking (

BookingID, UserID, UName, UEMail, Ucontact, TempleID, TName, Tlocation, PriestID, priestName, priestContact, ticketID, Booking Date, Darshan Date, Timeslot, Ticket type, price, payementID, Payment Mode, Payment status, Transaction Date.

)

Step(a): Apply functional dependencies → Normalize to 1NF.

first, identify functional dependencies (FDs):

1) UserID :→ UName, UEmail, Ucontact.

2) TempleID → TName, Tlocation.

3) PriestID → PriestName, priestcontact.

4) TicketID → Tickettype, Price

5) PaymentID → Payment mode, Payment status

step(b): Normalize using FD+ and α+

Candidate Keys:

ID (Main unique identifier of a booking).

DELETE Particular Booking.

```
MATCH (b; Booking { BookingID: 'B001' })
DELETE b
```

"VEL TECH - CSE

Result:

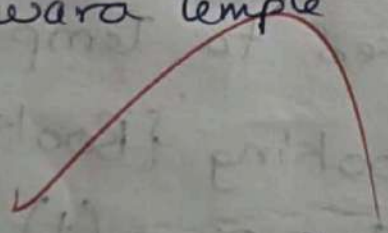
By following the above steps we successfully created, inserted, queried, updated, and deleted nodes and relationships in the temple ticket Booking Management system using Neouj Graph Database

Output

d. devotee ID	d. Name	d. Age	d. Phone
D001	Raj Kumar	30	9876543210

output

t. Temple ID	t. Name	t. location	t. Capacity
T007	Sri venkatesh -wara Temple	Tirupati	5000



→ Create a Booking Node.

```
CREATE (b: Booking { BookingID: 'B001',
  DevoteeID : 'D007',
  TempleID : 'T009',
  Return b.
```

Create Relationships

→ Devotee makes Booking.

```
MATCH (d: Devotee { DevoteeID : 'D001'})
CREATE (d) - [: MADE] → (b)
RETURN d, b.
```

→ Booking linked to Temple.

```
MATCH (b: Booking {BookingID: 'B007'})
CREATE (b) - [: FOR] -> (t)
RETURN b, t.
```

Display All Nodes

```
MATCH (n) RETURN n.
```

Retrieve particular Booking Details.

```
MATCH (b: Booking { BookingID : 'B003'})
RETURN b.
```

Update particular Devotee Details.

```
MATCH (d: Devotee {DevoteeID : 'D003'})
SET d.phone = '9876543210', d.Age = 31
RETURN d.
```

DATE: 18/09/25.

Task-9 : CRUD operations in Graph databases.

Aim :

To perform CRUD operations like creating, quering, updating, and deleting an graph spaces for an online temple ticket Booking management system.

step 1 : set up Neouj-AuraDB.

* click start free → continue with google → open.
* copy the downloaded password file into and login to the Aura console.
* start executing queries in the Neouj Browser.

Create nodes with properties.

each node represents an entity like devotee, Temple and Booking.

Create a Devotee Node :

```
CREATE(d: Devotee {Devotee ID : 'D007',
    Name : 'Raj Kumar',
    Age : 30,
    phone : '9876543210',
    Return D.
```

Create a Temple Node :

```
CREATE(t: temple {Temple ID : 'T001',
    Name : 'Sri venkateshwara temple',
    location : 'Tirupati'
    RETURN T.
```

5. output:

{"_id": objectId("6s1c1f72bebfe7993adf903"),
"Booking ID": "B003",
"Temple Name": "Kapaleeshwarar Temple",
"location": "chennai",
"DevoteeName": "Priya",
"phone": 9966332211,
"Booking Date": "2025-09-15"
}

6. output

{"acknowledged": True, "matched count": 1,
"modified count": 1}

7. output

{"acknowledged": True, "deletedCount": 1}

{ Booking ID : "Boo4", Temple Name : "Anna malaiyar Temple", Location : "Thiruvannamalai", Devotee Name : "Anitha", Phone : 9955886644, Booking Date : "2025-09-20" }

])

4. find records

db. Temple Booking. find()

5. Pretty format find.

db. Temple Booking. find(). pretty()

6. update a record.

db. Temple Booking. update one(

{ Booking ID : "B003" },

{ $set : { phone : 9123456789,

Devotee Name : "priya sharma" } }

)

7. Delete a record.

db. Temple Booking. delete one ({ Booking ID : "Boo4" })

EX	8
DELETE ONE	3
RESULT AND ANALYSIS (5)	5

objectid("651c1F726bebfe7993adf904")
]}

4. output.

{"_id": objectid("651c1f726bcbfe7993adf901"), "Booking ID": "Boo1", "Temple Name": "Sri venkateswara Temple", "location": "Tirupati", "Devotee Name": "Ramesh", "phone": 9876543210, "Booking Date": "2025-09-10"}

{"_id": objectid("651c1f726befe7993adf902"), "Booking ID": "Boo2", "TempleName": "Meenakshi Amman Temple", "location": "Madurai", "Devotee Name": "Suresh", "phone": 9876501234, "Booking Date": 2025-09-12"}

step 4 : open a command prompt and type mongosh -- help to confirm installation.

step 5 : open Mongo shell 4.0 from c:\ 'program files\mongoDB\server\bin\mongod.exe'

step 6 : Type the CRUD (Create, Read, update Delete) commands in MongoDB.

CRUD operations

1. Create collection

db.Createcollection("Temple Booking")

{"ok":1}

2. Insert one Record.

db.Temple Booking.insertone(

{BookingID:"B001", Templename:"sri Venkateswara Temple", location:"Tirupati", Devotee Name: "Ramesh", phone: 9876543210, Booking Date: "2025-09-10"}.

)

3. Insert many records.

db.Temple Booking.insertMany([

{BookingID:"B002", TempleName:"Meenakshi Amman Temple", location:"Madurai", Devotee Name:"suresh", phone: 9876501234, Booking Date: "2025-09-12"},

{BookingID:"B003", TempleName:"Kapaleeshwarar Temple", location:"chennai", Devotee Name: "Priya", phone: 9966332111, Booking Date: "2025-09-15"},

Task-8: CRUD operations in Document Databases.

Aim: To perform CRUD using NPM design on MongoDB for Temple online booking management system, designing a document database and performing CRUD operations like creating, querying, finding, updating and deleting.

Steps:

Step 1: Install MongoDB using the following link:

https://www.mongodb.com/try/download/community.

Step 2: Install mongosh using the below link:

https://www.mongodb.com/docs/mongodb-shell/#download-and-install-mongosh

Step 3: To add mongoDB shell binary's location to your PATH Environment variable.

- 3.1 open the control panel.
- 3.2 Go to system and security → system
- 3.3 click Advanced system settings
- 3.4 click Environment variables.
- 3.5 In system variables, seled path and
- 3.6 click edit
- 3.6 Add the filepath to your mongosh binary
- 3.7 click ok to confirm.

Example:

```
DECLARE
    temple_id NUMBER := 10;
    Even_ids SYS.ODCINUMBERLIST;
BEGIN
    Get Even Booking IDs For Temple (temple_id,
Even_ids);
    FOR i IN 1 .. Even_ids.COUNT loop
    DBMS_OUTPUT.PUT_LINE ('Even Booking ID:'
    || Even_ids (i));
    END loop;
    END;
/
```

Result:

Thus the Triggers, views and Exceptions experiment for Temple online Booking management system was successfully completed and results are verified.

7.b)

SELECT * FROM Devotee Booking Details;

o/p:

Devotee ID Devoteename Email
TempleName TicketID BookingDate visit Date
No. of tickets Amount

7.c):

Execution ex:

```
BEGIN
    GET Even TicketID D3 For Temple('TMP01');
END;
/
```

o/p:

Even TicketID : T102
Even TicketID : T104

To display:

```
SELECT * FROM Booking Details;
```

(c) Procedure.

To write a non-recursive PL/SQL procedure to retrieve even-numbered Booking IDs registered for any temple

```
CREATE OR REPLACE PROCEDURE
    Get Even Booking IDs for Temple(
    in_temple_id    IN NUMBER,
    out_Even_booking_ids OUT
    SYS.ODC IN NUMBER LIST.
    )AS
BEGIN
    out_Even_booking_ids :=
    sys. ODC IN NUMBER LIST();
FOR rec IN (SELECT booking_id
        FROM bookings
        WHERE temple_id = in_temple_id.
        AND MOD (booking_id, 2) = 0)
LOOP
        out_Even_booking_ids.EXTEND;
out_Even_booking_ids (out_Even_booking_
IDs.COUNT) := rec.booking_id;
    END LOOP;
    END;
```

7.a) Execution ex:-

```
INSERT INTO Ticket Bookings
(username, Temple Name, Pooja Name, Booking Date,
Booking Time, Number of people)
VALUES ('Ravi kumar', 'sri venkateswara
Temple', 'Abhishekam', TO_DATE ('2025-09-08',
'YYYY-MM-DD'), '10:00:00', 3);
```

O/P Ex:

Booking ID	User Name	Temple Name	Pooja Name	Booking Date
1.	Ravi Kumar	Sri venkateswara Temple	Abhishekam	2025-09-25
2	Midhuna	Meenakshi Amman Temple	Madurai	2025-11-25

O/P

```
INSERT INTO booking_audit (audit_id,
booking_id, user_id, temple_id, slot_id,
new_status, audit_ts)
    VALUES
(booking_audit_seq.NEXTVAL, :new.booking_id, :
new.user_id; :new.temple_id; :new.slot_id; :
NVL(:new.status, 'PENDING'), SYSDATE);
END;
/
```

(b) View

To create a view that displays the details of bookings along with the user and temple details.

```
CREATE OR REPLACE VIEW Booking Details As
SELECT b.booking_id,
       u.user_id,
       u.full_name. As User Name,
       u.mobile As User Mobile,
       t.temple_name,
       &.t.temple_id
       s.slot_id,
       s.slot_time,
       b.status,
       b.created_at.
FROM bookings b
JOIN users u ON b.user_id = u.user_id.
JOIN temples t ON b.temple_id = t.temple_id
JOIN slots s ON b.slot_id = s.slot_id;
```

Use Case Flow:

Step	Description.
1.	The Defence Data Analyst i/p and consolidates equipment maintenance data
2	The system integrates data from historical and real-time sources
3.	Predictive analytics identifies potential equipment failures and spare past needs.
4.	The system performs "what-if" analytics for deployment and logistics cost simulation.
5.	Reports and dashboards are generated for decision-makers to plan operators.

Result:

Thus, the Army supply chain and Maintenance Cost MS provides a robust analytical solution.

Output:-

- Graphical dashboards showing cost trends and failure rates
- Forecasted spare parts and maintenance schedules
- Comparative reports on deployment and maintenance costs under different scenarios.

4). To perform multi-dimensional cost comparison and trend analysis.

5) To provide decision-makers with "what-if" scenario simulations for deployment.

Actors:

- Defence Data Analysts
- logistics offices.
- Maintenance engineer.
- Command Head quarters,
- Supply chain Manager.

Preconditions:-

- All equipment, maintenance, and logistic data are digitized and stored in a central system.
- The system must support integration with graph databases and analytics tools

Post Conditions:

- optimized resource allocation and maintenance scheduling
- Reduced unpredictable maintenance costs through predictive analytics.
- Improved forecasting accuracy for spare parts and supply chain managements.

Aim:

To design a data-driven model that efficiently manages and analyses the Army's supply chain, Bill of materials (BOM), and equipment maintenance costs using advanced data management and analytics techniques.

Description:

The nation's armed forces consist of over one million soldiers and approximately 2,00,00 civilian staff. Each personal depends on various equipment such as helicopters, armored vehicles, small arms, Communication devices, and other critical resources. Since maintenance, operation, and support costs account for nearly 80% of the total lifecycle costs, it is crucial for the Defence Ministry to accurately track, analyze, and forecast maintenance and supply requirements.

objectives:

1) To integrate and manage Army equipment data, maintenance logs, and BOM efficiently.
2) To forecast spare part requirements based on environmental and operational conditions.
3) To evaluate the mean time to failure equipment.

Use Case-04

DATE : 16/10/25

Army Supply Chain, Bill of Materials and maintenance Cost Management.

4. Write PL/SQL code for bussiness logic, such as:
   - Validating booking dates.
   - checking ticket availability
   - Processing payments
5. Test the forms inside Oracle Forms Builder for functionality and data accuracy.

Create Reports:

Reports provide summarised information about bookings and temple vists.

Steps to create reports using Oracle Report Builder:

1. open oracle Report Builder.
2. Create a new report or use an existing templeat.
3. Define the data source for the report using queries or PL/SQL procedures. Examples reports:
   - Dialy Ticket Sales Report
   - Booking Summary by Temple
   - Revenue Report.
4. Design the Report layout with headers, footers, and detailed data columns (e.g., booking date, ticket type, amount).
5. Add parameters to allow filtering (e.g., data range, temple name).
6. Generate and prte preview the report to verify the data accuracy and presentation.
